

Tech vs Nature

My passion project will be an interactive website that will feature questions that the user will have to choose between nature and technology, if he chooses nature, then technology will suffer and if he chooses technology then it's going to be nature that suffers. In the end, it's going to show how choosing technology doesn't mean that nature suffers, showing how nature and technology aren't opposites. I need to research those questions to ask and papers that demonstrate how technology can coexist with nature. Also, it would be nice to research some fine assets for the web page like images, colors, etc., so it looks nice. For resources, I will need those papers, a laptop, and that's all.

For the first week I will research those papers and the questions to ask, and I will start building the website with those questions featuring two side, nature and technology and both sides will be themed respectively and this will overflow a bit into the second week. On the second week the most important part will be the interactivity.

By November 16th the question are already fully researched and a basic structure of the website is designed/implemented and the themes colors are chosen.

By November 18th the static website is done and the themes colors and questions are applied to it, they show up, interactivities buttons are also implemented.

By November 22nd the main logic of the interactive part is implemented, the questions work well and adding finishing touches to the website

By November 25th this is some buffer time for unexpected things and bugs and also time to implement last minute changes and ideas and add some last finishing touches.
